

**SOME QUESTIONS REGARDING LARGE DEVIATIONS OF  
RANDOM WALKS IN A RANDOM ENVIRONMENT**

Srivinasa Varadhan

NYU

Large deviations deals with rare events. The events in question have a small probability and conditioning with respect to them changes the original measure considerably. It is interesting to be able to say some thing about this conditional distribution. We will look at some examples of this, including random walks or diffusions in a random medium that is forced to drift with a velocity that is different from what is expected from the law of large numbers.
